

Game Concept:

Create an arcade game where a spaceship navigates an asteroid field, avoiding collisions while shooting and destroying asteroids.

Visuals (No images/SVGs allowed):

- Use HTML/CSS for a retro-futuristic design.
- Animate the spaceship's propellant based on movement (e.g., longer flames for forward thrust).
- Create a starfield background with parallax scrolling for depth.
- Design asteroids with varying size, speed, and rotation using pure HTML/CSS.
- Destroyed asteroids break into fragments, which must also be avoided or shot.
- Add an animated laser beam effect for shooting.

Gameplay Mechanics:

- Control the spaceship with smooth keyboard input for all directions.
- Display limited lives visually.
- Shooting lasers has a cooldown with a recharging bar indicator.
- Collisions with asteroids or fragments reduce lives.
- Add a scoring system with higher points for larger asteroids or fragments.
- Increase difficulty over time with faster, more frequent asteroids.
- Include a game over screen with final score and restart option.

Code Structure:

- Write all code in a single HTML file with organized, commented JavaScript.
- Ensure smooth performance even with many asteroids and fragments.

Bonus Challenge:

- Add a "hyperspace" feature to teleport the spaceship randomly. Include a

small chance of malfunction (e.g., teleporting into an asteroid). Limit uses or add recharge time.

Provide all code in one HTML file.
